

Kevin Brown

MCT (Microsoft Certified Trainer) since 2000, Azure Security Engineer, Azure Solutions Architect, Azure Administrator, MCSE,

CISSP

Who is this course for?

- ☐ Those that have some experience with Azure or have taken the Azure Fundamentals: AZ-900 course
- □ Those wanting to learn more about Azure through hands-on exercises and demonstrations
- ☐ Those that want to become Azure certified

Azure Resource Links

Azure Trial Account

https://azure.microsoft.com/free/

Azure Portal

https://portal.azure.com/app/download

Azure Storage Explorer

https://azure.microsoft.com/features/storage-explorer/

Azure Administration:

- □ Azure Portal and Cloud Shell
- ☐ Azure PowerShell and CLI
- □ Resource Manager
- □ ARM Templates

Azure Virtual Machines:

- ☐ Virtual Machine Planning
- ☐ Creating Virtual Machines
- ☐ Virtual Machine Availability
- □ Virtual Machine Extensions
- Dedicated Hosts

Azure Virtual Machines:

- ☐ Virtual Machine Planning
- ☐ Creating Virtual Machines
- ☐ Virtual Machine Availability
- □ Virtual Machine Extensions
- Dedicated Hosts

Azure Storage:

- Storage Accounts
- □ Blob Storage
- ☐ Table Storage
- ☐ Queue Storage
- □ Azure Files

Virtual Networking:

- □ Virtual Networks
- ☐ IP addressing
- ☐ Azure DNS
- Network Security Groups

Intersite Connectivity:

- VNet Peering
- VNet-to-VNet Connections
- ExpressRoute
- ☐ Custom Routes
- ☐ Azure Load Balancer
- ☐ Azure Traffic Manager

Azure Monitoring:

- □ Azure Monitor
- □ Azure Alerts
- Network Watcher

Data Protection:

- □ Data Replication Types
- ☐ Azure Data Backup
- □ Azure Virtual Machine Backup

Azure Active Directory:

- ☐ Understanding Azure Active Directory
- □ Azure AD Connect
- ☐ Azure AD Join
- Multi-Factor Authentication (MFA)
- ☐ Azure Identity Protection (AIP)

Governance and Compliance:

- Subscriptions and Accounts
- ☐ Azure Users and Azure Groups
- ☐ Role-based Access Control (RBAC)
- ☐ Azure Policy
- □ Azure Management Groups
- ☐ Azure Security Center

Data Services:

- ☐ Content Delivery Network (CDN)
- ☐ Azure File Sync
- □ Data Box Types

Course Updates

- The AZ-104 course will be updated as the official Microsoft exam changes
- Currently exam changes are approximately every 4-6 months

Learning Objectives

What you will learn:

- Azure Portal and Cloud Shell
- Azure PowerShell and CLI
- Resource Groups
- ARM Templates

Azure Portal and Cloud Shell Overview

- Azure Portal Website
- Azure Portal App
- Azure Mobile App
- Azure Cloud Shell

Azure Portal

- Search and manage resources
- Create customized dashboards and favorites
- Access the Cloud Shell
- Receive notifications
- Managing subscriptions and billing

https://portal.azure.com/App/Download

Azure Mobile App

- Stay connected to the cloud, when mobile
- Check status and alerts
- Troubleshoot issues from any location
- Run commands to manage your Azure resources from mobile devices

Azure Cloud Shell

- Interactive, browser-accessible shell
- Offers either Bash or PowerShell
- Is temporary and provided on a persession, per-user basis
- Requires a resource group, storage account, and Azure File share
- Authenticates automatically
- Times out after 20 minutes

Welcome to Azure Cloud Shell

Select Bash or PowerShell. You can change shells any time via the environment selector in the Cloud Shell toolbar. The most recently used environment will be the default for your next session

Bash (Linux) PowerShell (Windows)

Azure PowerShell

Authenticate to your Azure subscription and manage resources

Available as a local installation on Linux, macOS, or Windows

Azure Command Line Interface (CLI)

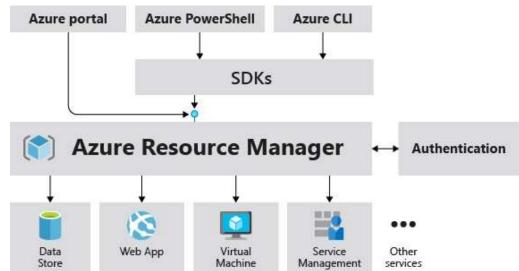

- Runs on Linux, macOS, and Windows
- Can be used interactively or used to run scripts
- Syntax is not the same as Bash or Powershell
- Use *find* to locate commands
- Use --help for more detailed information
- Can be used with Python and Java

https://aka.ms/InstallAzureCLIwindows

Resource Manager

 Provides a consistent management layer

- Enables you to work with the resources in your solution as a group
- Create, update or delete in a single operation
- Provides security and auditing
- Choose the tools that work best for you

Azure Resources

- A resource is simply a single service instance in Azure
- A resource group is a logical grouping of resources

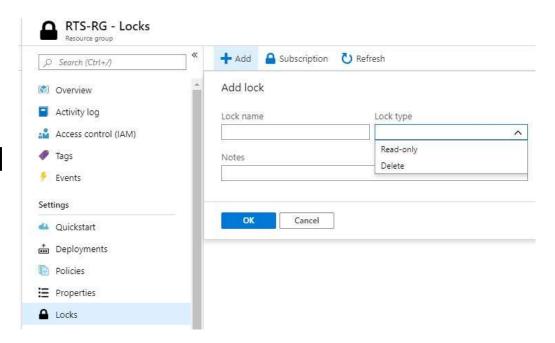

Azure Resources

 Resources can only exist in one resource group

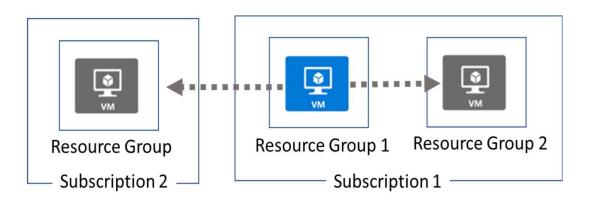

- Groups cannot be renamed
- Groups can have resources of many different types (services)
- Groups can have resources from many different regions

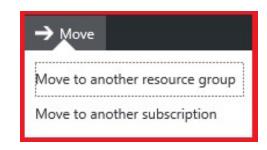

Azure Resource Locks

- Associate the lock with a subscription, resource group, or resource
- Locks are inherited by child resources
- Read-Only locks prevent any changes to the resource
- Delete locks prevent deletion

Moving Resources between Resource Groups

 When moving resources, both the source group and the target group are locked during the operation

ARM Templates Overview

- Improves consistency
- Define complex deployments
- Reduce errors
- Define requirements through code
- Can be reused

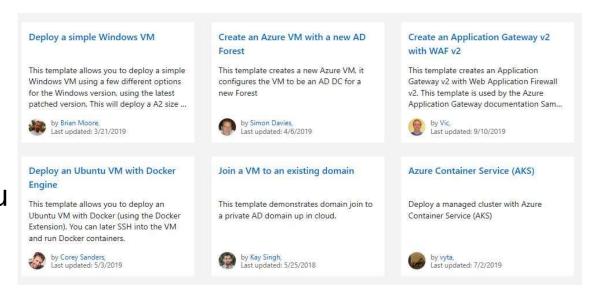

Template Variables

- Define values that are used throughout the template
- Makes your templates easier to maintain
- This example provides variables that describe network configuration for a virtual machine

```
"variables": {
    "nicName": "myVMNic",
    "addressPrefix": "10.0.0.0/16",
    "subnetName": "RTSSubnet",
    "subnetPrefix": "10.0.0.0/24",
    "publicIPAddressName": "RTSPublicIP",
    "virtualNetworkName": "RTSVNET"
}
```

QuickStart Templates

- Resource Manager templates provided by the Azure community
- Provides everything you need to deploy your solution or serves as a starting point for your template

https://azure.microsoft.com/resources/templates/

Learning Objectives

What you will learn:

- Virtual Machine Planning
- Creating Virtual Machines
- Virtual Machine Availability

Virtual Machine Planning Overview

- IaaS Cloud Services
- Planning Checklist
- Location and Pricing
- Virtual Machine Sizing
- Virtual Machine Disks
- Storage Options
- Supported Operating Systems

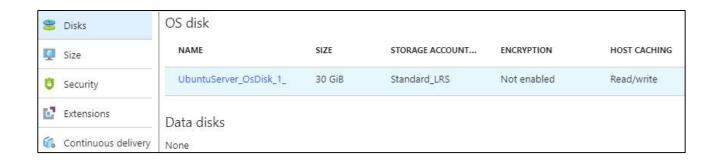

Virtual Machine Planning

- Start with the network
- Name the VM
- Determine the location for the VM
- Determine the size of the VM
- Understand the pricing models
- Consider storage types for the VM
- Choose an operating system

Virtual Machine Types

VM Type	Sizes	Purpose	
General Purpose		Testing and development, small to medium databases, and low to medium traffic web servers.	
Compute Optimized	Fsv2, Fs, F	Medium traffic web servers, network appliances, batch processes, and application servers.	
Memory Optimized	Esv3, Ev3, M, GS, G, DSv2, Dv2	Relational database servers, medium to large caches, and in-memory analytics.	
Storage Optimized	Lsv2, Ls	Ideal for VMs running databases.	
GPU	NV, NVv2, NC, NCv2, NCv3, ND, NDv2 (Preview)	Ideal for model training and inferencing with deep learning.	
High Performance Compute	Н	Fastest and most powerful CPU virtual machines with optional high-throughput network interfaces.	

Understanding Virtual Machine Disks

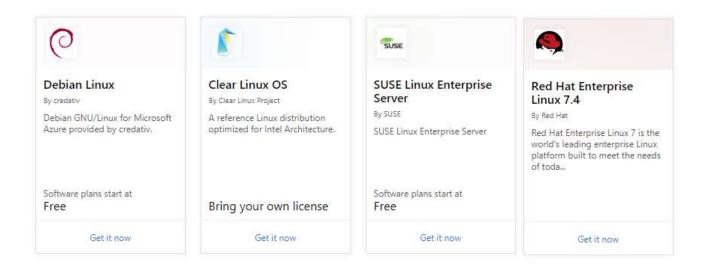

- Operating System Disks are SATA drives, labeled as C:
- Temporary Disks provides short term storage
- Data Disks are SCSI drives and depend on your virtual machine type

Storage Types

- Premium storage offers high-performance, lowlatency SSD disk support
- Use premium storage for virtual machines with input/output (I/O)-intensive workloads
- Two types of disks: Unmanaged and Managed
 - Unmanaged disks require you to manage the storage accounts and VHDs
 - Managed disks are maintained by Azure (recommended)

Linux Virtual Machines

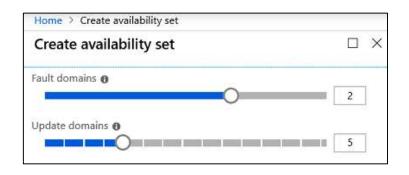

- Hundreds of community-built images in the Azure Marketplace
- Linux has the same deployment options as for Windows VMs
- Manage Linux VMs with many popular opensource DevOps tools

Linux VM Connections

- Authenticate with a SSH public key or password
- SSH is an encrypted connection protocol that allows secure logins over unsecured connections
- There are public and private keys

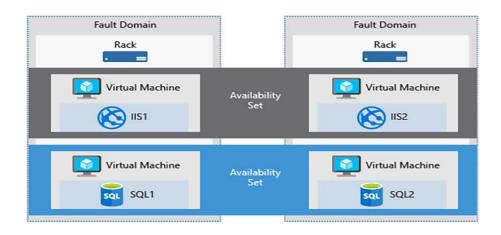

Availability Sets

Two or more instances in two or more availability zones = 99.99% uptime

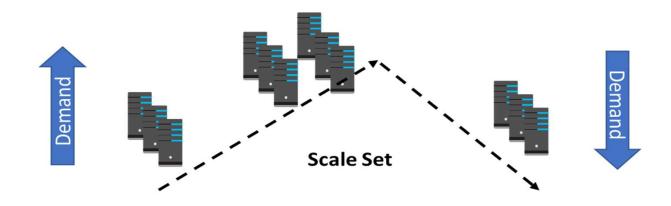

- Configure multiple virtual machines in an Availability Set
- Configure each application tier into separate Availability Sets

Update and Fault Domains

- Update domains lets Azure to perform incremental or rolling upgrades across a deployment. During planned maintenance, only one update domain is rebooted at a time.
- Fault Domains are a group of virtual machines that share a common set of hardware, switches, that share a single point of failure. VMs in an availability set are placed in at least two fault domains.

Scale Sets

- Scale sets deploy a set of identical VMs
- No pre-provisioning of VMs is required
- As demand goes up VMs are added
- As demand goes down VM are removed
- The process can be manual, automated, or a combination of both

Virtual Machine Extensions

- Extensions are small applications that provide postdeployment VM configuration and automation tasks
- Managed with Azure CLI, PowerShell, Azure Resource Manager templates, and the Azure portal
- Bundled with a new VM deployment or run against any existing system
- Different for Windows and Linux machines.

Changes to Azure Information Protection Licensing

AIP Licensing

https://azure.microsoft.com/pricing/details/information-protection/

Microsoft 365

https://www.microsoft.com/en-us/microsoft-365/try

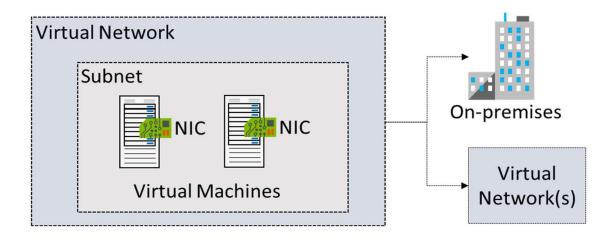

Learning Objectives

What you will learn:

- Virtual Networks
- IP Addressing and Endpoints
- Azure DNS
- Network Security Groups

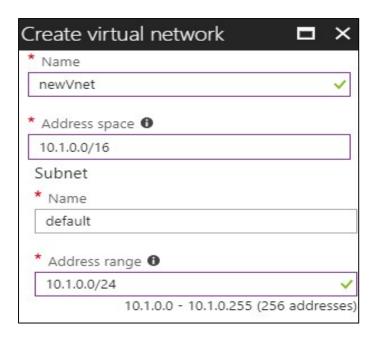

Virtual Networks

- Logical representation of your own network
- Create a dedicated private cloud-only VNet
- Securely extend your datacenter With VNets
- Enable hybrid cloud scenarios

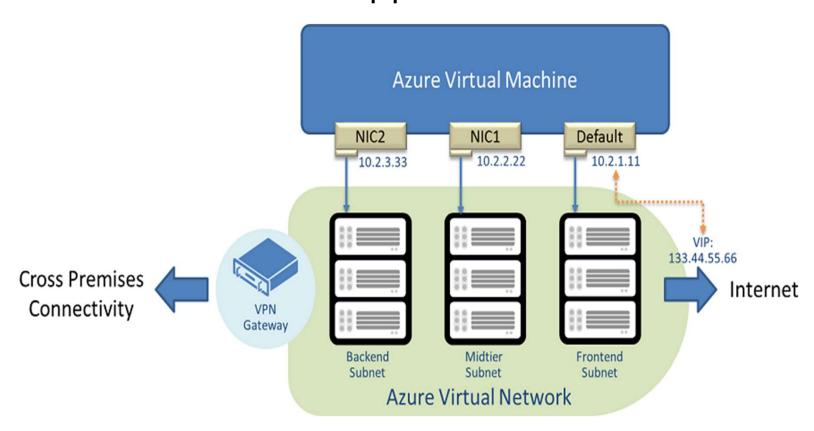

Implementing Virtual Networks

- Create new virtual networks at any time
- Add virtual networks when you create a virtual machine
- Need to define the address space, and at least one subnet
- Be careful with overlapping address spaces

Multiple NICs in Virtual Machines

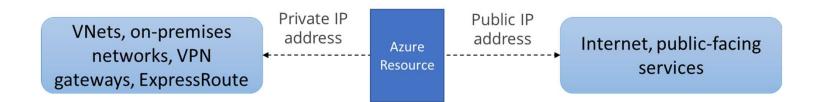

- You can create virtual machines with multiple NICs
- The VM size determines the number of NICs that can be supported

IP Addressing Overview

- IP Addressing
- Public IP Addresses
- Private IP Addresses
- Demonstration Manage IP Addresses
- Service Endpoints
- Service Endpoint Services
- Secure Access to Storage
- Demonstration Service Endpoints

IP Addressing

- Private IP addresses are used within an Azure virtual network (VNet), and your on-premises network, when you use a VPN gateway or ExpressRoute circuit to extend your network to Azure
- Public IP addresses is used for communication with the Internet, including Azure public-facing services

Public IP Addresses

NIC	Yes	Yes
Front-end configuration	Yes	Yes
Gateway IP configuration	Yes	No
Front-end configuration	Yes	No

 A public IP address resource can be associated with virtual machine network interfaces, internet-facing load balancers, VPN gateways, and application gateways.

Private IP Addresses

NIC	Yes	Yes
Front-end configuration	Yes	Yes
Front-end configuration	Yes	Yes

- Dynamic (default). Azure assigns the next available unassigned or unreserved IP address in the subnet's address range
- Static. You select and assign any unassigned or unreserved IP address in the subnet's address range

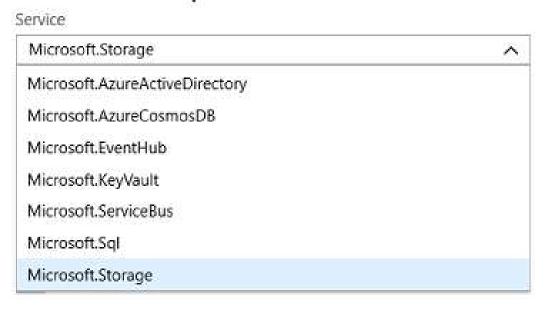

Service Endpoints

- Endpoints limit network access to specific subnets and IP addresses
- Improved security for your Azure service resources
- Optimal routing for Azure service traffic from your virtual network
- Endpoints use the Microsoft Azure backbone network

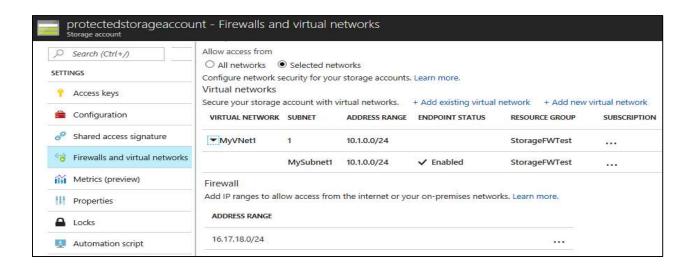

Service Endpoint Services

Add service endpoints

✓ Adding service endpoints can take up to 15 minutes to complete

Secure Access to Storage Endpoints

- Must configure both sides of the endpoints. For example, the virtual network side and the storage account side.
- Each service endpoint has its own Azure documentation page

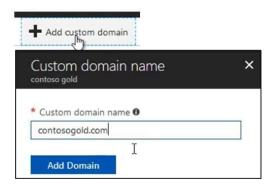

Azure DNS Overview

- Domains and Custom Domains
- Verifying Custom Domain Names
- Azure DNS Zones
- DNS Record Sets
- DNS Delegation
- DNS for Private Domains
- Private Zones Scenarios
- Demonstration DNS Name Resolution

Domains and Custom Domains

- When you create an Azure subscription an Azure AD domain is created for you
- The domain has initial domain name in the form domainname.onmicrosoft.com
- You can customize/change the name
- After the custom name is added it must be verified (next topic)

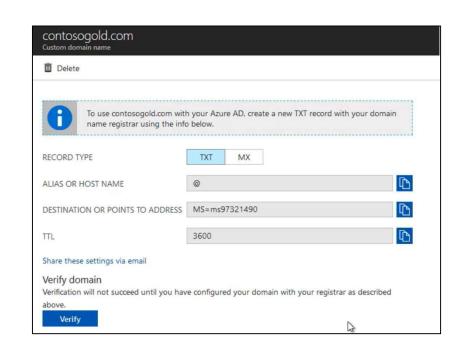

Verify the Custom Domain Name

- Verification demonstrates ownership of the domain name
- Add a DNS record (MX or TXT) that is provided by Azure into your company's DNS zone
- Azure will query the DNS domain for the presence of the record
- This could take several minutes or several

I_ _ _

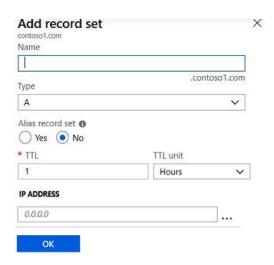

Azure DNS Zones

- A DNS zone hosts the DNS records for a domain
- The name of the zone must be unique within the resource group
- Where multiple zones share the same name, each instance is assigned different name server addresses
- Only one set of addresses can be configured with the domain name registrar

DNS Record Sets

- A record set is a collection of records in a zone that have the same name and are the same type
- You can add up to 20 records to any record set
- A record set cannot contain two identical records
- Changing the drop-down Type, changes the information required

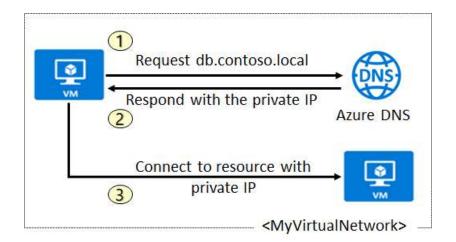

DNS Delegation

- When delegating a domain to Azure DNS, you must use the name server names provided by Azure DNS – use all four
- Once the DNS zone is created, update the parent registrar
- For child zones, register the NS records in the parent domain

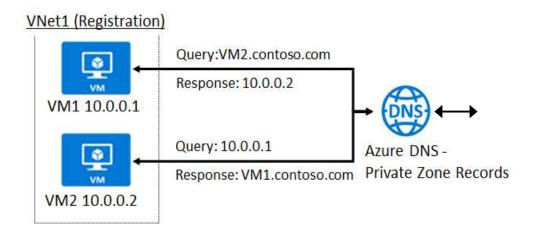

DNS for Private Domains

- Use your own custom domain names
- Provides name resolution for VMs within a VNet and between VNets
- Automatic hostname record management
- Removes the need for custom DNS solutions
- Use all common DNS records types
- Available in all Azure regions

Private Zone Scenarios

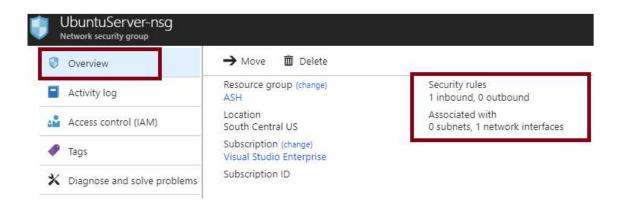

- DNS resolution in VNet1 is private and not accessible from the Internet
- DNS queries across the virtual networks are resolved
- Reverse DNS queries are scoped to the same virtual network

Network Security Groups Overview

- Network Security Groups
- NSG Rules
- NSG Effective Rules
- Creating NSG Rules
- Demonstration NSGs

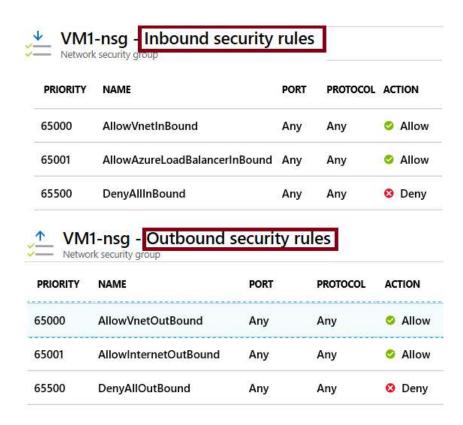

Network Security Groups (NSG)

- You can limit network traffic to resources in a virtual network using a NSG
- A NSG contains a list of security rules that allow or deny inbound or outbound network traffic
- An NSG can be associated to a subnet or a network interface

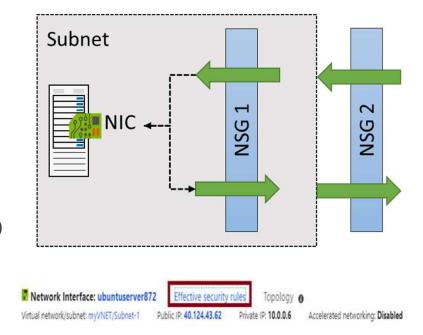

NSG Rules

- Security rules in NSGs enable you to filter network traffic that can flow in and out of virtual network subnets and network interfaces.
- There are default security rules. You cannot delete the default rules, but you can add other rules with a higher priority.

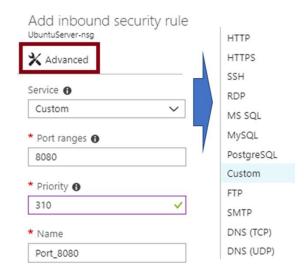

NSG Effective Rules

- NSGs are evaluated independently for the subnet and NIC
- An "allow" rule must exist at both levels for traffic to be admitted
- Use the Effective Rules link if you are not sure which security rules are being applied

Creating NSG Rules

- Select from a large variety of services
- Service The destination protocol and port range for this rule
- Port ranges Single port or multiple ports
- Priority The lower the number, the higher the priority

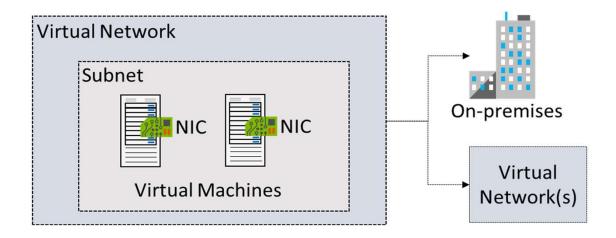

Learning Objectives

What you will learn:

- Virtual Networks
- IP Addressing and Endpoints
- Azure DNS
- Network Security Groups

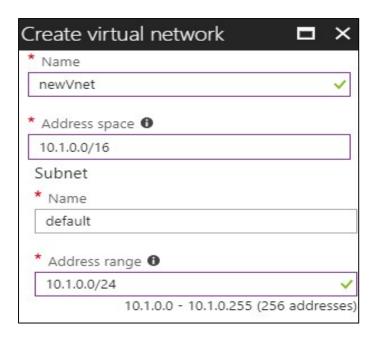

Virtual Networks

- Logical representation of your own network
- Create a dedicated private cloud-only VNet
- Securely extend your datacenter With VNets
- Enable hybrid cloud scenarios

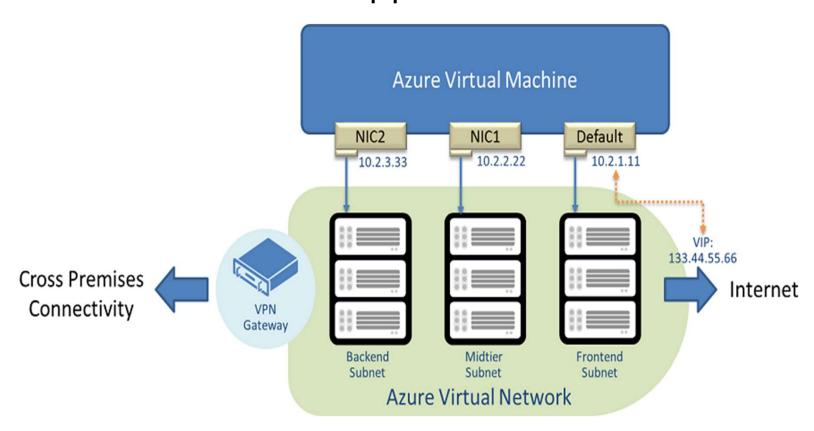

Implementing Virtual Networks

- Create new virtual networks at any time
- Add virtual networks when you create a virtual machine
- Need to define the address space, and at least one subnet
- Be careful with overlapping address spaces

Multiple NICs in Virtual Machines

- You can create virtual machines with multiple NICs
- The VM size determines the number of NICs that can be supported

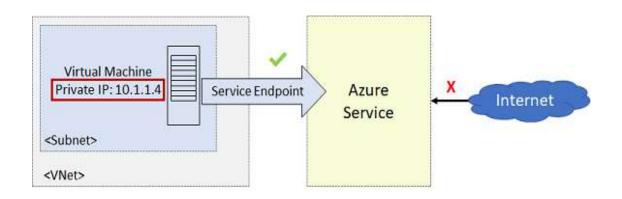

IP Addressing

 Private IP addresses are used within an Azure virtual network (VNet) and your on-premises network

 Public IP addresses is used for communication with the Internet, including Azure public-facing services

IP addresses can be Static or Dynamic

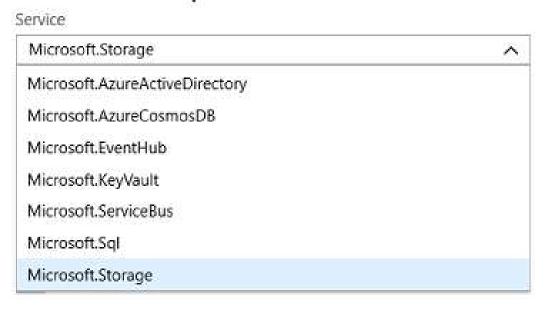

Service Endpoints

- Endpoints limit network access to specific subnets and IP addresses

- Optimal routing for Azure service traffic from your virtual network
- Endpoints use the Microsoft Azure backbone network

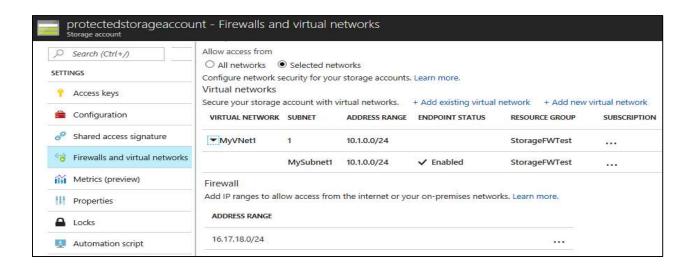

Service Endpoint Services

Add service endpoints

✓ Adding service endpoints can take up to 15 minutes to complete

Secure Access to Storage Endpoints

- Must configure both sides of the endpoints. For example, the virtual network side and the storage account side.
- Each service endpoint has its own Azure documentation page

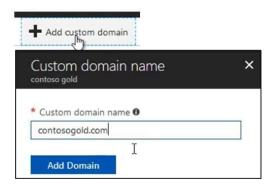

Azure DNS Overview

- Domains and Custom Domains
- Verifying Custom Domain Names
- Azure DNS Zones
- DNS Record Sets
- DNS Delegation
- DNS for Private Domains
- Private Zones Scenarios
- Demonstration DNS Name Resolution

Domains and Custom Domains

- When you create an Azure subscription an Azure AD domain is created for you
- The domain has initial domain name in the form domainname.onmicrosoft.com
- You can customize/change the name
- After the custom name is added it must be verified (next topic)

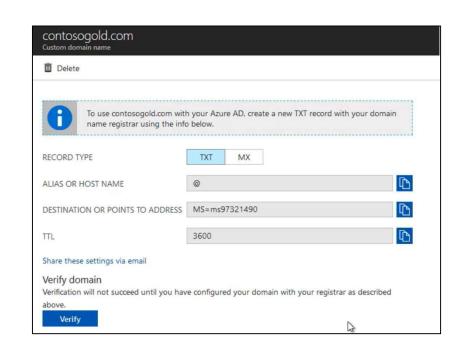

Verify the Custom Domain Name

- Verification demonstrates ownership of the domain name
- Add a DNS record (MX or TXT) that is provided by Azure into your company's DNS zone
- Azure will query the DNS domain for the presence of the record
- This could take several minutes or several

I_ _ _

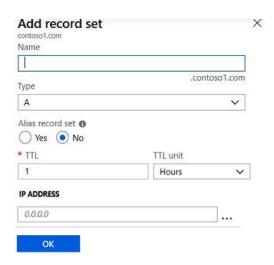

Azure DNS Zones

- A DNS zone hosts the DNS records for a domain
- The name of the zone must be unique within the resource group
- Where multiple zones share the same name, each instance is assigned different name server addresses
- Only one set of addresses can be configured with the domain name registrar

DNS Record Sets

- A record set is a collection of records in a zone that have the same name and are the same type
- You can add up to 20 records to any record set
- A record set cannot contain two identical records
- Changing the drop-down Type, changes the information required

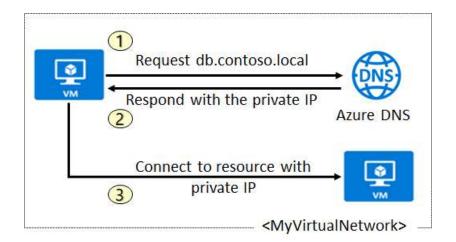

DNS Delegation

- When delegating a domain to Azure DNS, you must use the name server names provided by Azure DNS – use all four
- Once the DNS zone is created, update the parent registrar
- For child zones, register the NS records in the parent domain

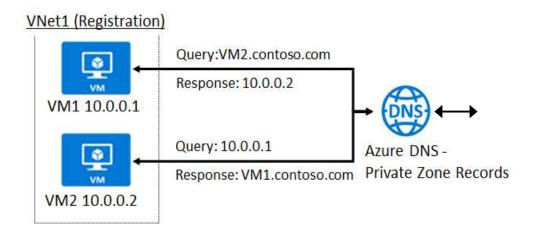

DNS for Private Domains

- Use your own custom domain names
- Provides name resolution for VMs within a VNet and between VNets
- Automatic hostname record management
- Removes the need for custom DNS solutions
- Use all common DNS records types
- Available in all Azure regions

Private Zone Scenarios

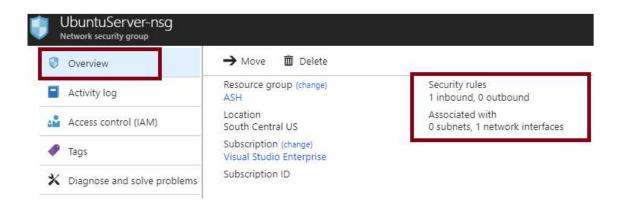

- DNS resolution in VNet1 is private and not accessible from the Internet
- DNS queries across the virtual networks are resolved
- Reverse DNS queries are scoped to the same virtual network

Network Security Groups Overview

- Network Security Groups
- NSG Rules
- NSG Effective Rules
- Creating NSG Rules
- Demonstration NSGs

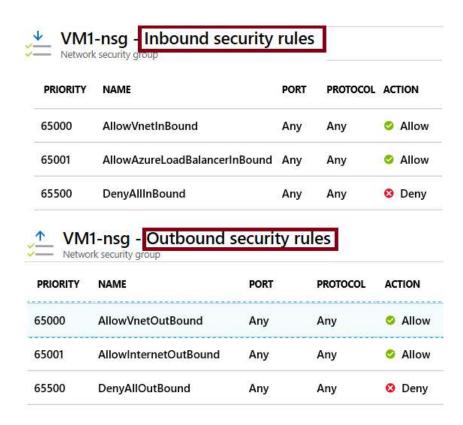

Network Security Groups (NSG)

- You can limit network traffic to resources in a virtual network using a NSG
- A NSG contains a list of security rules that allow or deny inbound or outbound network traffic
- An NSG can be associated to a subnet or a network interface

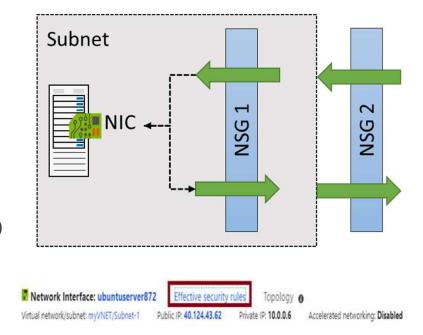

NSG Rules

- Security rules in NSGs enable you to filter network traffic that can flow in and out of virtual network subnets and network interfaces.
- There are default security rules. You cannot delete the default rules, but you can add other rules with a higher priority.

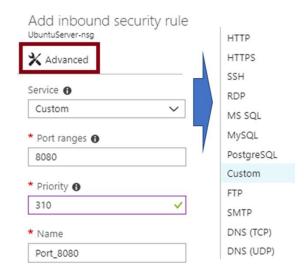

NSG Effective Rules

- NSGs are evaluated independently for the subnet and NIC
- An "allow" rule must exist at both levels for traffic to be admitted
- Use the Effective Rules link if you are not sure which security rules are being applied

Creating NSG Rules

- Select from a large variety of services
- Service The destination protocol and port range for this rule
- Port ranges Single port or multiple ports
- Priority The lower the number, the higher the priority

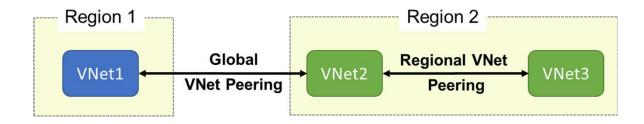

Learning Objectives

What you will learn:

- VNet Peering
- VNet-to-VNet Connections
- ExpressRoute

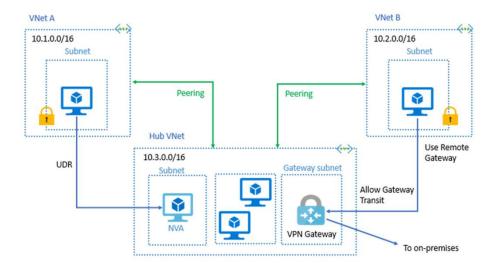

VNet Peering

- VNet peering connects two Azure virtual networks
- Two types of peering: Regional and Global

Gateway

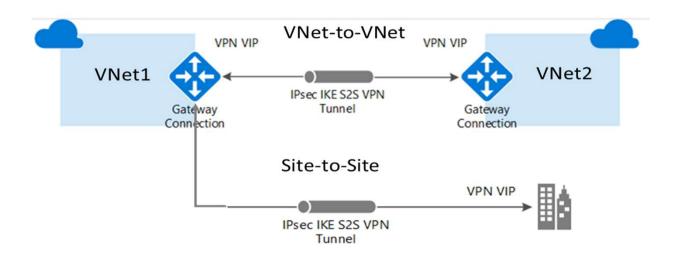

- Gateway transit allows peered virtual networks to share the gateway and get access to resources
- No VPN gateway is required in the peered virtual network
- Default VNet peering provides full connectivity

Azure Portal Update

- VPN Gateway has been renamed to Virtual Network
 Gateway in the most recent update of the Azure Portal
- Most documentation still uses the term VPN Gateway

Implement VNet-to-VNet Connections

- Connect VNets with a VNet-to-VNet VPN connection
- Requires a VPN gateway (virtual network gateway) in each virtual network
- A secure IPsec/IKE tunnel provides the communication
- Use when VNet peering is not an option
- Never deploy other resources (for example, additional VMs) to the gateway subnet.
- Avoid associating a NSG with the gateway subnet.

Connect your datacenter to Azure

 Azure Virtual Network Gateway connects your on-premises networks to Azure through Site-to-Site VPNs in a similar way that you set up and connect to a remote branch office. The connectivity is secure and uses the industry-standard protocols Internet Protocol Security (IPsec) and Internet Key Exchange (IKE).

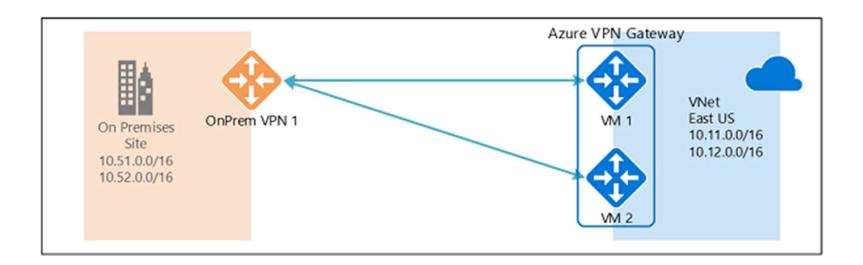

Connect your datacenter to Azure

 Azure Virtual Network Gateway connects your on-premises networks to Azure through Site-to-Site VPNs in a similar way that you set up and connect to a remote branch office. The connectivity is secure and uses the industry-standard protocols Internet Protocol Security (IPsec) and Internet Key Exchange (IKE).

Active-Active VPN

You can now create an Azure virtual network gateway in an activeactive configuration, where both instances of the gateway VMs will establish S2S VPN tunnels to your on-premises VPN device, as shown the following diagram:

Configure the On-Premises VPN Device

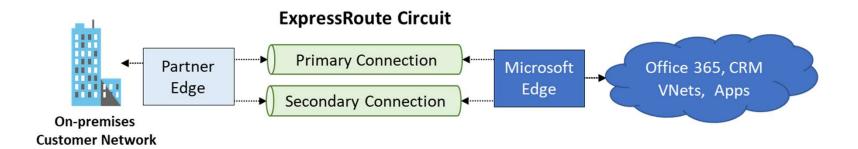

- Consult the list of supported VPN devices (Cisco, Juniper, Ubiquiti, Barracuda Networks)
- A VPN device configuration script may be available
- Remember the shared key for the Azure connection (next step)
- Specify the public IP address (previous step)

ExpressRoute Connections Overview

- ExpressRoute
- ExpressRoute Capabilities
- ExpressRoute Connections
- Coexisting Site-to-Site and ExpressRoute

ExpressRoute

- Extends on-premises networks into Microsoft cloud with dedicated private connections
- Excellent for data migration, business continuity, and disaster recovery
- Cost-effective option for transferring datasets
- Adds high throughput and fast latency capacity to your datacenter

ExpressRoute Capabilities

 Layer 3 connectivity with redundancy

Connectivity to all regions within a geography

 Global connectivity with ExpressRoute

 Bandwidth options – 50 Mbps to 10 Gbps

Learning Objectives

What you will learn:

- Azure Monitor tools
- Azure Alerts
- Network Watcher

Azure Monitor

Activity Log

Who, What, When for operations

Example:

- Who started a VM
- Who deallocated a VM
- Who deleted a vNet

Azure Monitor

Azure Alerts

- Resource
- Condition
- Action

Learning Objectives

What you will learn:

- Data Replication
- Data Backups
- Virtual Machine Backups

Replication Options

Types of storage replication

- Locally-redundant Storage (LRS)
- Zone-redundant Storage (ZRS)
- Geo-redundant Storage (GRS)
- Read-access Geo-redundant Storage (RA-GRS)
- Geo-zone-redundant Storage (GZRS)
- Read-access Geo-zone-redundant Storage (RA-GZRS)

Locally-redundant Storage

- Locally redundant storage (LRS) replicates your data three times within a single data center. LRS provides at least 99.999999999999 (11 nines). LRS is the lowest-cost replication option and offers the least durability compared to other options.
- If a datacenter-level disaster (for example, fire or flooding) occurs, all replicas in a storage account using LRS may be lost or unrecoverable. To mitigate this risk, Microsoft recommends using zone-redundant storage (ZRS), geo-redundant storage (GRS), or geo-zone-redundant storage (GZRS).

Zone-redundant Storage

- Zone-redundant storage (ZRS) replicates your data synchronously across three storage clusters in a single region. Each storage cluster is physically separated from the others and is located in its own availability zone (AZ).
- A write request to a ZRS storage account returns successfully only after the data is written to all replicas across the three clusters.

Geo-redundant Storage

- GRS replicates your data to another data center in a secondary region, but that data is available to be read only during a failure
- RA-GRS is based on GRS and replicates data to another data center in another region. Provides read access from the secondary region, even without a failure
- Geo-redundant storage (GRS) is designed to provide at least
 99.99999999999999 (16 9's) durability of objects over a given year

Geo-zone-redundant Storage

- Geo-zone-redundant storage (GZRS) (preview) marries the high availability of zone-redundant storage (ZRS) with protection from regional outages as provided by geo-redundant storage (GRS).
- Data in a GZRS storage account is replicated across three Azure availability zones in the primary region and also replicated to a secondary geographic region for protection from regional disasters. Each Azure region is paired with another region within the same geography, together making a regional pair.
- Read-access-Geo-zone-redundant is also available in preview (RAGZR)

Azure Backup

- Offload on-premise backup
- Backup Azure VMs
- Unlimited data transfer
- Data security
- Locally redundant storage (LRS) or geo-redundant storage of backups (GRS)

Azure File Share Backup

- Backup on demand
- Scheduled backup
- Restore individual files
- Restore entire file share
- Restore to original location or alternate location

Azure VM Backup

- Backup on demand
- Schedule backup
- Virtual machine restore

Recovery Services Vault

On-premise backup to Azure

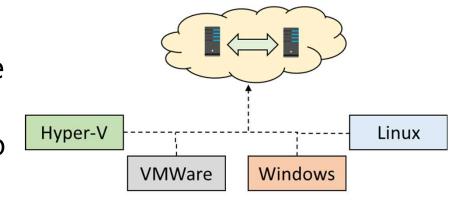

- Download and Install MARS agent
 - Files and Folders
 - Hyper-V virtual machines
 - Vmware virtual machines
 - SQL Servers
 - SharePoint Servers
 - Exchange Servers
 - System State
 - Bare Metal Recovery

Recovery Services Vault

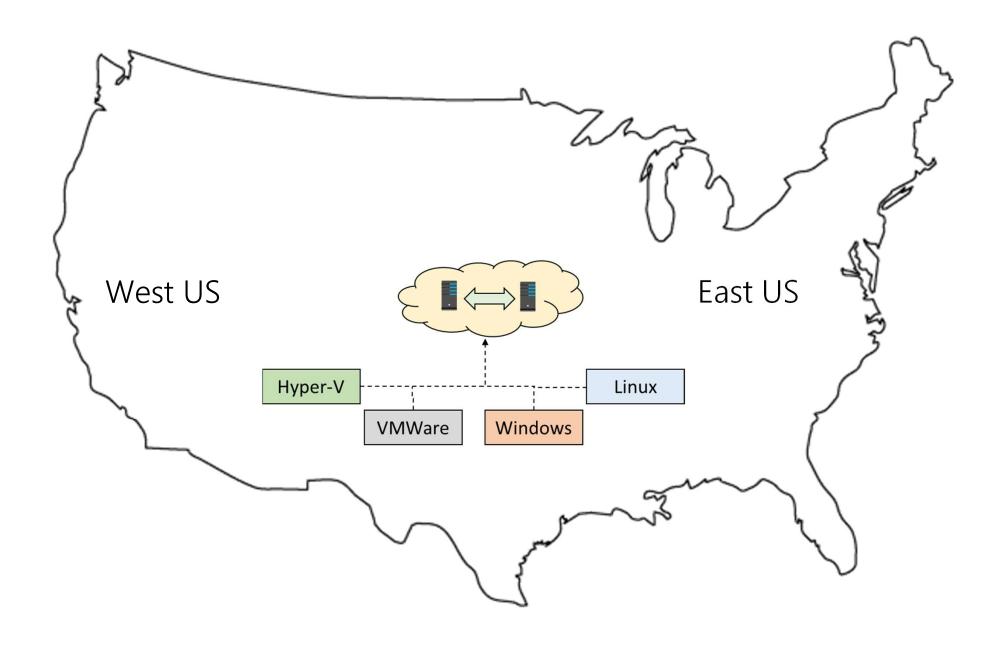

Azure Backup Items

- Virtual Machines
- Azure File Share
- SQL Server in Azure VM

- Replicate Azure VMs from one Azure region to another
- Replicate on-premises VMware VMs, Hyper-V VMs, physical servers (Windows and Linux) to Azure

 Replicate on-premises VMware VMs, Hyper-V VMs managed by System Center VMM, and physical servers to a secondary site

Benefits

- Eliminate disaster recovery sites
- Reduced infrastructure costs
- Protect complex workloads
- Monitoring

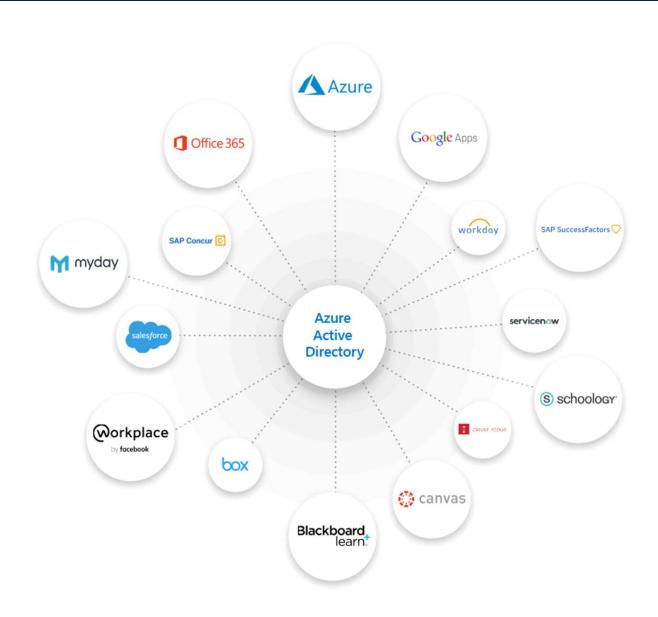

Learning Objectives

What you will learn:

- The purpose of Azure Active Directory
- Azure AD Connect
- AD Join

Azure Active Directory

Comparing Active Directory on-premise to Azure AD

 Authentication is performed using LDAP over port 389

 Authentication is performed through a number of protocols such as SAML, WS-Federation, and OAuth. It's possible to query Azure AD but instead of using LDAP you use a REST API called AD Graph API. These all work over HTTP and HTTPS

Hybrid AD Joined Devices

- You can join personal devices to Azure AD
- Company owned/Domain joined devices can be joined to Azure AD

Multi-Factor Authentication

- Requires Azure AD Premium
- Global Administrators: MFA is free of charge
- Call to phone
- Text message to phone
- Mobile app notification
- Verification through mobile app
- Cache 1-60 days

Azure AD Identity Protection

Azure AD Premium 2 or Enterprise Mobility Suite (EMS)

Risk Events

- Leaked Credentials
- Sign-in from anonymous IPs
- Impossible travel
- Sign-in from unfamiliar locations
- Sign-in from infected devices

Azure Active Directory Editions

- Azure Active Directory Free Provides user and group management, on-premises directory synchronization, basic reports, self-service password change for cloud users, and single sign-on across Azure, Office 365, and many popular SaaS apps. Supports 500,000 objects.
- Azure Active Directory Office 365 No object limit, multi-factor authentication, two-way sync.
- Azure Active Directory Premium P1 hybrid users access both on-premises and cloud resources. It also supports advanced administration, such as dynamic groups, self-service group management, Microsoft Identity Manager (an on-premises identity and access management suite) and cloud write-back capabilities, which allow self-service password reset for your on-premises users.
- Azure Active Directory Premium P2 Azure Active Directory Identity Protection to help provide risk-based Conditional Access to your apps and critical company data and Privileged Identity Management to help discover, restrict, and monitor administrators.

https://azure.microsoft.com/en-us/pricing/details/active-directory/

Azure AD Tenants

- A tenant is an instance of Azure AD
- Multiple tenants can be created under an Azure subscription

Azure AD Cloud Sync

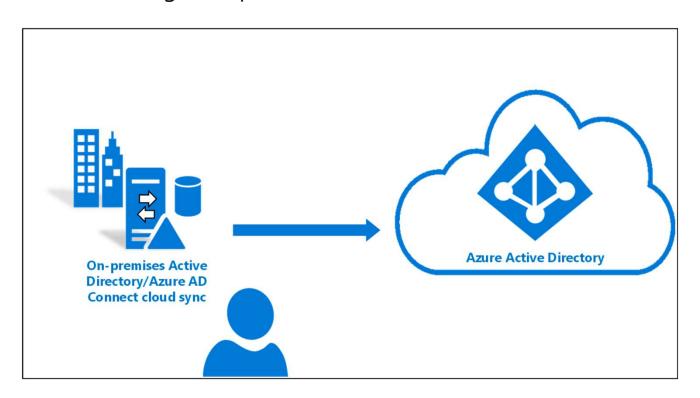

Azure AD Connect cloud sync is new offering from Microsoft designed to meet and accomplish your hybrid identity goals for synchronization of users, groups and contacts to Azure AD. It accomplishes this by using the Azure AD cloud provisioning agent instead of the Azure AD Connect application. However, it can be used alongside Azure AD Connect sync and it provides the following benefits:

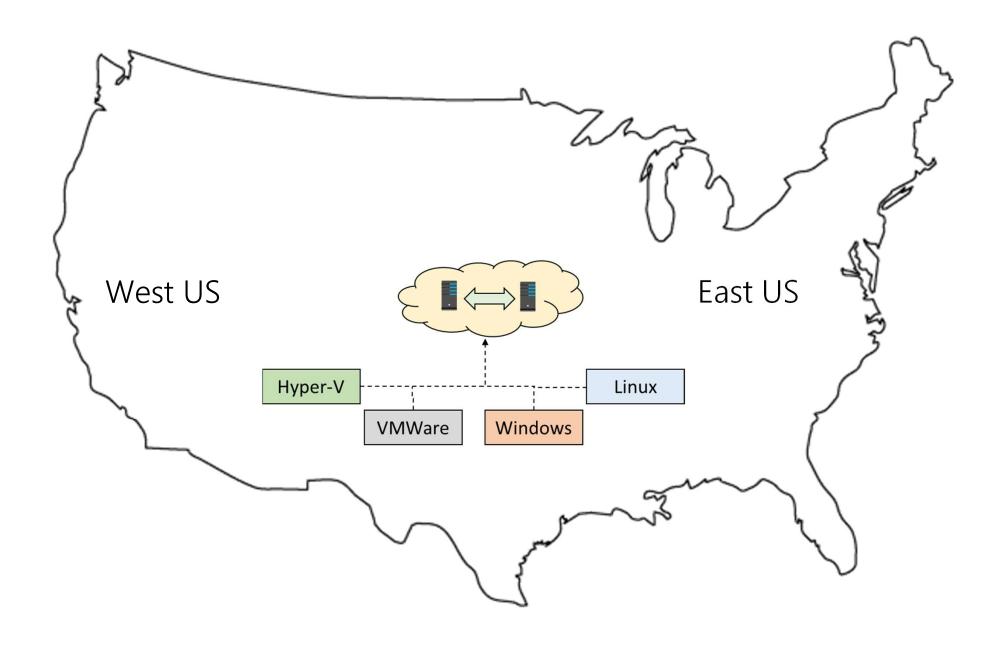

- Support for synchronizing to an Azure AD tenant from a multi-forest disconnected Active
 Directory forest environment: The common scenarios include merger & acquisition (where
 the acquired company's AD forests are isolated from the parent company's AD forests),
 and companies that have historically had multiple AD forests.
- Simplified installation with light-weight provisioning agents: The agents act as a bridge from AD to Azure AD, with all the sync configuration managed in the cloud.
- Multiple provisioning agents can be used to simplify high availability deployments, particularly critical for organizations relying upon password hash synchronization from AD to Azure AD.
- Support for large groups with up to 50K members. It is recommended to use only the OU scoping filter when synchronizing large groups.

Azure AD Cloud Sync

How is Azure AD Connect cloud sync different from Azure AD Connect sync?

 With Azure AD Connect cloud sync, provisioning from AD to Azure AD is orchestrated in Microsoft Online Services. An organization only needs to deploy, in their on-premises or laaS-hosted environment, a light-weight agent that acts as a bridge between Azure AD and AD. The provisioning configuration is stored in Azure AD and managed as part of the service.

Azure Load Balancer

Front-End Back-End Health Probes Nat Rules

VM-Web01

Load Balancer

VM-Web02

VM-Web03

Learning Objectives

What you will learn:

- Azure App Service Plans
- Container Service
- Kubernetes Service

Azure App Service Plans Overview

- Azure App Service Plans
- App Service Plan Pricing Tiers
- App Service Plan Scaling
- App Service Plan Scale Out

Azure App Service Plans

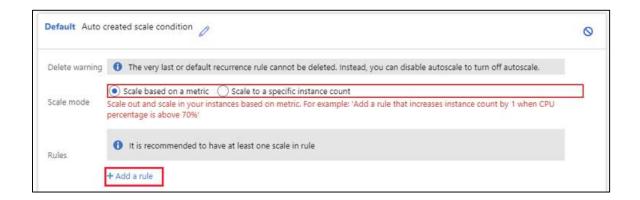

- Define a set of compute resources for a web app to run
- Determines performance, price, and features
- One or more apps can be configured to run in the same App Service plan
- App Service plans define:
 - Region where compute resources will be created
 - Number of virtual machine instances
 - Size of virtual machine instances (Small, Medium, Large)
 - Pricing tier

App Service Plan Scaling

- Scale up (change the App Service plan)
 - More hardware (CPU, memory, disk)
 - More features (dedicated virtual machines, staging slots, autoscaling)
- Scale out (increase the number of VM instances)
 - Manual (fixed number of instances)
 - Autoscale (based on predefined rules and schedules)

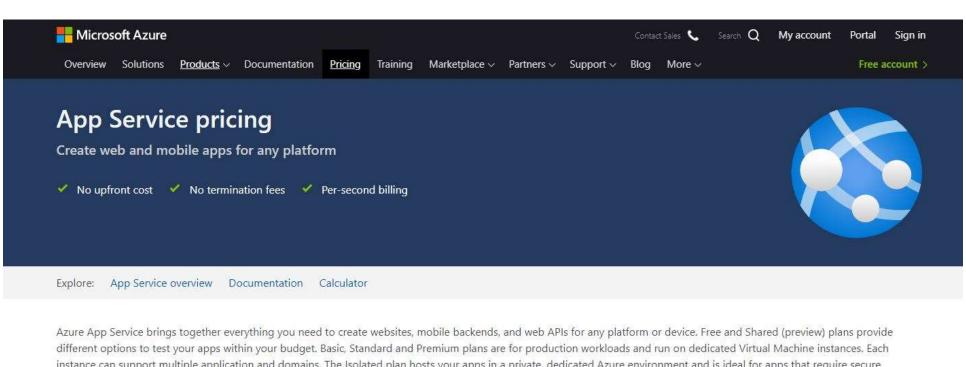

App Service Plan Automatic Scale

- Adjust available resources based on the current demand
- Improves availability and fault tolerance
- Scale based on a metric (CPU percentage, memory percentage, HTTP requests)
- Scale according to a schedule (weekdays, weekends, times, holidays)
- Can implement multiple rules combine metrics and schedules
- Don't forget to scale down

App Service Pricing

https://azure.microsoft.com/en-us/pricing/details/app-service/windows/

instance can support multiple application and domains. The Isolated plan hosts your apps in a private, dedicated Azure environment and is ideal for apps that require secure connections with your on-premises network, or additional performance and scale. App Service plans are billed on a per second basis.

OS/Software	Region:	Currency:	Display pricing by:
Windows ▼	Central US ▼	US Dollar (\$) ▼	Hour ▼

Azure App Service

- Includes Web Apps API Apps, Mobile Apps, and Function apps
- Fully managed environment enabling high productivity development
- Platform-as-a-service (PaaS) offering for building and deploying highly available cloud apps for web and mobile
- Platform handles infrastructure so developers focus on core web apps and services
- Developer productivity using .NET, .NET Core, Java, Python and a host of others
- Provides enterprise-grade security and compliance

Creating an App Service

- Name must be unique
- Access using azurewebsites.net
 - can map to a custom domain
- Publish Code (Runtime Stack)
- Publish Docker Image (Image source)
- Linux or Windows
- Region closest to your users
- App Service Plan

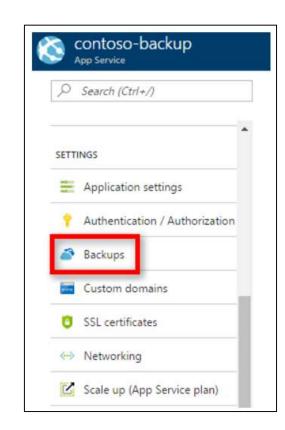

Deployment Slots

- Deploy to a different deployment slots (depends on service plan)
- Validate changes before sending to production
- Deployment slots are live apps with their own hostnames
- Avoids a cold start eliminates downtime
- Fallback to a last known good site

Service	Slots
Free, Shared, Basic	0
Standard	Up to 5
Premium	Up to 20
Isolated	Up to 20

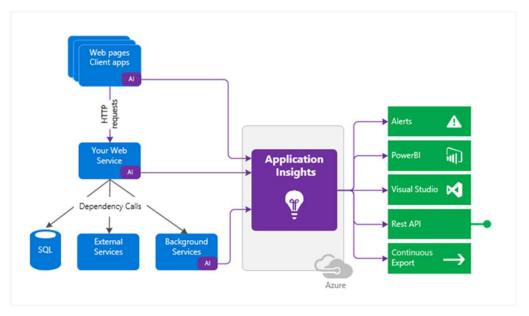

Backup an App Service

- Create app backups manually or on a schedule
- Backup the configuration, file content, and database connected to the app
- Requires Standard or Premium plan
- Backups can be up to 10 GB of app and database content
- Configure partial backups and exclude items from the backup
- Restore your app on-demand to a previous state, or create a new app

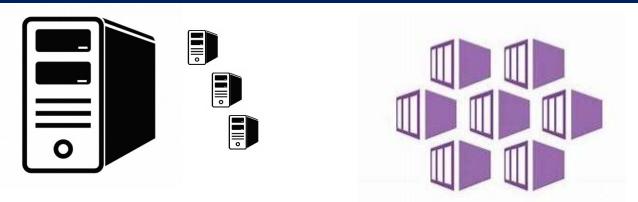

Application Insights

- Request rates, response times, and failure rates
- Dependency rates, response times, and failure rates
- Page views and load performance
- User and session counts
- Performance counters
- Diagnostics and Exceptions

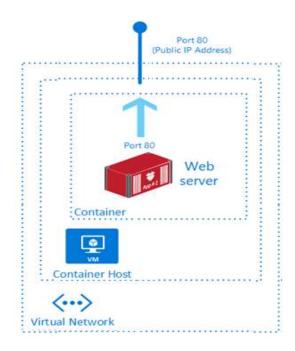

Containers vs Virtual Machines

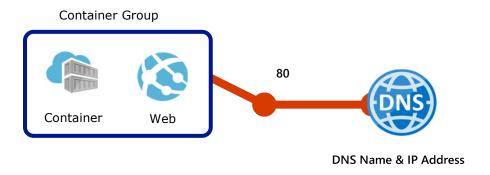

Feature	Containers	Virtual Machines
Isolation	Typically provides lightweight isolation from the host and other containers but doesn't provide as strong a security boundary as a virtual machine.	Provides complete isolation from the host operating system and other VMs. This is useful when a strong security boundary is critical, such as hosting apps from competing companies on the same server or cluster.
Operating system	Runs the user mode portion of an operating system and can be tailored to contain just the needed services for your app, using fewer system resources.	Runs a complete operating system including the kernel, thus requiring more system resources (CPU, memory, and storage).
Deployment	Deploy individual containers by using Docker via command line; deploy multiple containers by using an orchestrator such as Azure Kubernetes Service.	Deploy individual VMs by using Windows Admin Center or Hyper-V Manager; deploy multiple VMs by using PowerShell or System Center Virtual Machine Manager.
Persistent storage	Use Azure Disks for local storage for a single node, or Azure Files (SMB shares) for storage shared by multiple nodes or servers.	Use a virtual hard disk (VHD) for local storage for a single VM, or an SMB file share for storage shared by multiple server.
Fault tolerance	If a cluster node fails, any containers running on it are rapidly recreated by the orchestrator on another cluster node.	VMs can fail over to another server in a cluster, with the VM's operating system restarting on the new server.

Azure Container Instances

- PaaS Service
- Fast startup times
- Public IP connectivity and DNS name
- Hypervisor-level security
- Isolation features
- Custom sizes
- Persistent storage
- Linux and Windows Containers

Container Groups

- A collection of containers that get scheduled on the same host
- The containers in the group share a lifecycle, resources, local network, and storage volumes

Docker

- Enables developers to host applications within a container
- A container is a standardized "unit of software" that contains everything required for an application to run
- Available on both Linux and Windows and can be hosted on Azure

Lesson 04: Azure Kubernetes Service

Kubernetes core concepts for Azure Kubernetes Service (AKS)

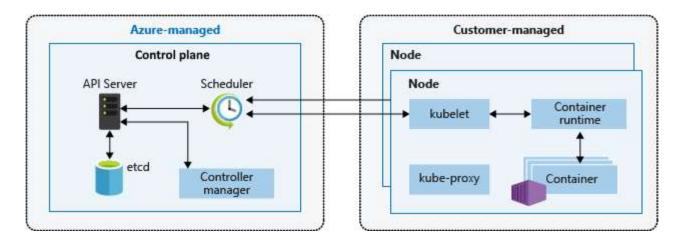

As application development moves towards a container-based approach, the need to orchestrate and manage resources is important. Kubernetes is the leading platform that provides the ability to provide reliable scheduling of fault-tolerant application workloads. Azure Kubernetes Service (AKS) is a managed Kubernetes offering that further simplifies container-based application deployment and management.

What is Kubernetes?

- Kubernetes is a rapidly evolving platform that manages container-based applications and their associated networking and storage components. The focus is on the application workloads, not the underlying infrastructure components.
- You can build and run modern, portable, microservicesbased applications that benefit from Kubernetes and manage the availability of those application components.
- As an open platform, Kubernetes allows you to build your applications with your preferred programming language.
- The AKS control plane is managed by the Azure platform, and you only pay for the AKS nodes that run your applications. AKS is built on top of the open-source Azure Kubernetes Service Engine

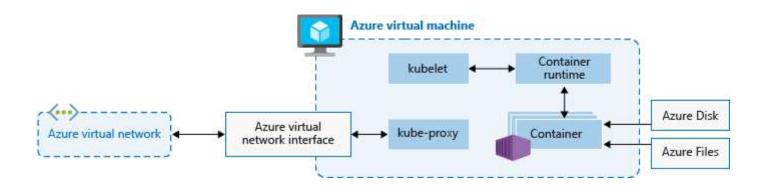

Kubernetes Cluster Architecture

The control plane includes the following core Kubernetes components:

- kube-apiserver The API server is how the underlying Kubernetes APIs are exposed.
 This component provides the interaction for management tools, such as the Kubernetes dashboard.
- *etcd* To maintain the state of your Kubernetes cluster and configuration, the highly available *etcd* is a key value store within Kubernetes.
- *kube-scheduler* When you create or scale applications, the Scheduler determines what nodes can run the workload and starts them.
- *kube-controller-manager* The Controller Manager oversees a number of smaller Controllers that perform actions such as replicating pods and handling node operations.

Kubernetes Cluster Architecture

- To run your applications and supporting services, you need a
 Kubernetes node. An AKS cluster has one or more nodes, which is an
 Azure virtual machine (VM) that runs the Kubernetes node components
 and container runtime:
- The kubelet is the Kubernetes agent that processes the requests from the control plane and scheduling of running the requested containers.
- Virtual networking is handled by the kube-proxy on each node. The proxy routes network traffic and manages IP addressing for services and pods.
- The container runtime is the component that allows containerized applications to run and interact with additional resources such as the virtual network and storage. In AKS, Moby is used as the container runtime.

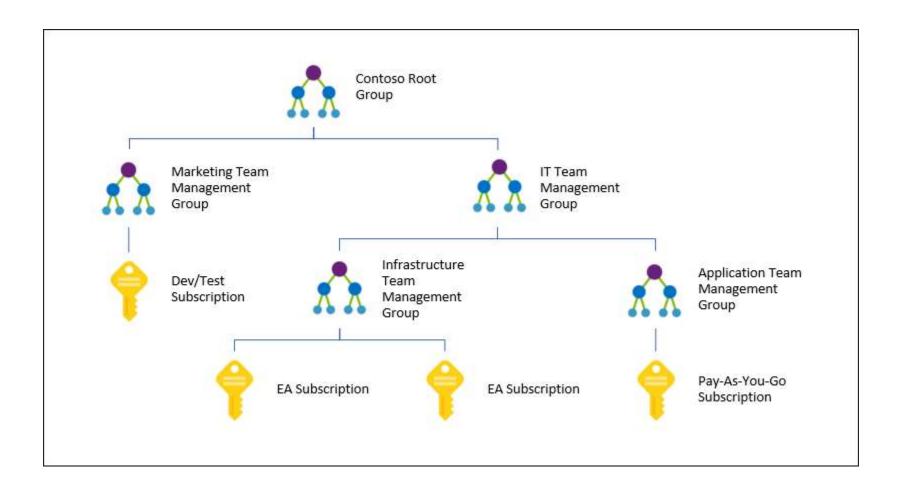

Learning Objectives

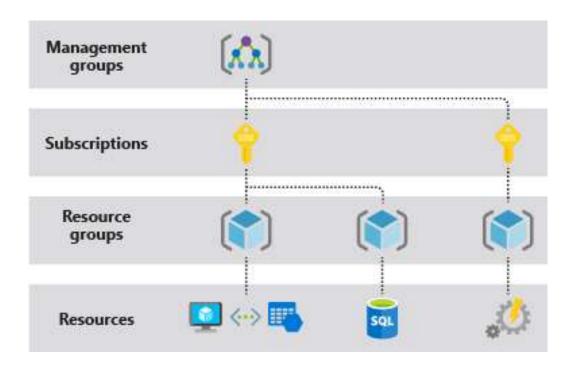

What you will learn:

- Subscription types
- Management groups
- Role based access (RBAC) control
- Azure policies

Azure Management Groups

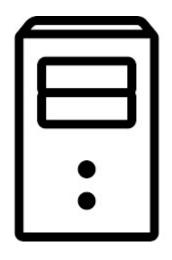

Azure Subscriptions

 Authentication is performed using LDAP ov er port 389

Azure File Sync

- .NET Framework 4.7.2 or newer
- AZ PowerShell Module
- Install Azure File Sync Agent and Register

- Storage Account
- Azure File Share
- Azure File Sync
- Define Server Endpoint

Azure AD Identity Protection

Azure AD Premium 2 or Enterprise Mobility Suite (EMS)

Risk Events

- Leaked Credentials
- Sign-in from anonymous IPs
- Impossible travel
- Sign-in from unfamiliar locations
- Sign-in from infected devices

Azure Policies

CDN

Policy Definition

Policy Definition

Initiative Definition

Subscription A

Subscription B

Learning Objectives

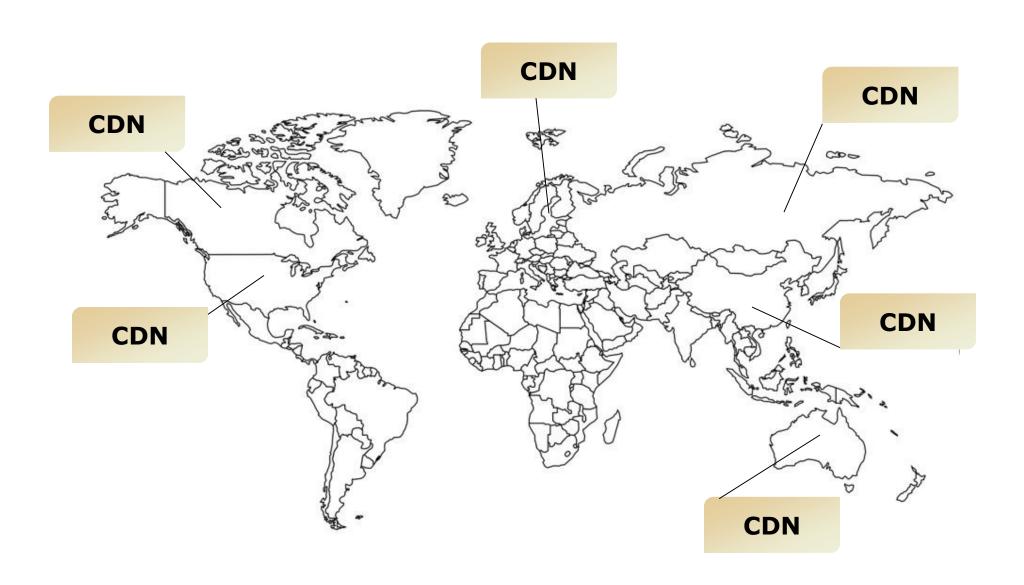

What you will learn:

- Content Deliver Networks
- Azure File Sync
- Data Box

Content Delivery Network

- Created as part of a storage account
- Deliver content to used based on geographic location
- Content can be streaming video
- Content can be images
- Often used to deliver content to mobile devices
- Supports compression
- Supports Time-to-live (TTL)

Content Delivery Network

Import/Export

- Migrate data to the cloud
- Content distribution
- Backup
- Data recovery
- WAImportExport tool

Data Services

Azure File Sync

Data Box offline

- Data Box: 100 TB, Azure Blobs of Files, SMB/NFS
- Data Box Disk: 40 TB, Azure Blob support, USB/SATA
- Data Box Heavy: 1 PB, Azure Blob or Azure Files, SMB/NFS

Data Box online

- Data Box Edge: Physical network appliance that transfers data to and from Azure
- Data Box Gateway: A virtual appliance based on a virtual machine
